## Numeration - Trillions

Genesis 1:14-19 And God said, "Let there be lights in the expanse of the sky to separate the day from the night, and let them serve as signs to mark seasons and days and years, and let there be lights in the expanse of the sky to give light on the earth." And it was so. God made two great lights, the greater light to govern the day and the lesser light to govern the night. He also made the stars. God set them in the expanse of the sky to give light on the earth, to govern the day and the night, and to separate light from darkness. And God saw that it was good. And there was evening, and there was morning the fourth day."

God took great care in creating our world. The massive size of our Solar System gives evidence of the omnipotence of our Heavenly Father. Scientists today measure the distance between planets in Astronomical Units (AU). An AU is the mean distance between the earth and the sun. One Astronomical Unit (AU) is about $92,960,000$ miles ( $149,604,970 \mathrm{Km}$ ). Look at the chart below. This chart lists the distances from each planet to the Sun in both Astronomical Units (AU) and miles. Can you read each number correctly?
Planet
Mercury
Venus
Earth
Mars
Jupiter
Saturn
Uranus
Neptune
rf Planet Pluto

| $\underline{\text { AU }}$ | Miles |
| ---: | ---: |
| 0.39 | $36,254,400$ |
| 0.72 | $66,931,200$ |
| 1 | $92,960,000$ |
| 1.52 | $141,299,200$ |
| 5.20 | $483,392,000$ |
| 9.54 | $886,838,400$ |
| 19.18 | $1,782,972,800$ |
| 30.06 | $2,794,377,600$ |
| 39.44 | $3,666,342,400$ |

The number can be written in three different ways.
Standard Form: 3,666,342,400
Written Form: Three billion, six hundred sixty-six million, three hundred forty-two thousand, four hundred
Expanded Form: 3,000,000,000 + 600,000,000 + 60,000,000 + 6,000,000 + 300,000 + OR $40,000+2,000+400$
Expanded Form: $(3 \times 1,000,000,000)+(6 \times 100,000,000)+(6 \times 10,000,000)+$ $(6 \times 1,000,000)+(3 \times 100,000)+(4 \times 10,000)+(2 \times 1,000)+$ ( $4 \times 100$ )

$$
\begin{array}{llll}
x \div 5=7 & x \div 9=9 & x \div 10=10 & x \div 13=3 \\
& \\
\frac{x}{7}=7 & \frac{x}{9}=8 & \frac{x}{9}=7 & \frac{x}{8}=6
\end{array}
$$

(2) Find the difference.

| 569,241 |
| ---: |
| $-531,955$ |$\quad$| 900,801 |
| ---: |

## 3 Find the sum.

90 9, 270
978,822
586,702
656,342
$\begin{array}{r}+400,969 \\ \hline\end{array}$

| $+568,097$ |
| :--- |

4 Write the measurement.

The straw is $\qquad$ inches long.

The candy is $\qquad$ inches long.
(2) Change each mixed fraction to an improper fraction.
$8 \frac{1}{5}=$ $\qquad$ $8 \frac{2}{9}=$
$3 \frac{7}{8}=$ $\qquad$
$16 \frac{4}{7}=$
$15 \frac{1}{2}=$
$17 \frac{1}{3}=$
$11 \frac{1}{6}=$
$12 \frac{3}{4}=$
$\underline{\square}$
(3) Find your way through the maze by finding the next greatest number.

(4) Use the chart to solve the following problems.

| 14 feet $=\ldots$ | inches |
| :--- | ---: |
| 4 miles $=\ldots$ | feet |
| 27 feet $=\ldots$ yards |  |
| 18 yards $=\ldots$ | feet |

## Division

Many times you can look at a division problem and tell if an answer is too high or too low by using your knowledge of division and multiplication to estimate the answer in your head. Look at the example below.

Karen and Doug were moving from Georgia to Alaska. The trip would cover 5,000 miles by automobile. If they allowed 14 days to drive, how many miles per day would they need to travel in order to complete the trip in that amount of time?
Problem A

$$
\begin{array}{r}
500 \\
1 4 \longdiv { 5 , 0 0 0 }
\end{array}
$$

Problem B
200
$1 4 \longdiv { 5 , 0 0 0 }$

Is the first answer shown too high of an estimate, or is the estimate too low? Think logically and use your knowledge of multiplication. If 14 rounds down to 10 , then $10 \times 500$ would be 5,000 . However, Doug and Karen have allowed 14 days. This means that the estimate in problem A of 500 miles per day is too large. What about the estimate in problem $B$ ? What is $14 \times 200$ ? $14 \times 2=28$, so $14 \times 200=2,800$. This estimate is too low. The correct answer must be somewhere between 200 and 500. Work the problem to find the actual number of miles they will need to travel each day.

$$
1 4 \longdiv { 5 5 , 0 0 0 }
$$

This means that Doug and Karen will need to drive at least 357 miles per day in order to reach Alaska in 14 days.

(1) Tell if the estimated answer is too high or too low. Then find the quotient.
$1 1 \longdiv { 2 0 0 }$
500
4,596
$2 3 \longdiv { 2 , 1 1 1 }$
$5 \begin{array}{r}400 \\ 829\end{array}$

## Classifying and Measuring Angles

An angle is two rays that share a common end point.
The rays $\overrightarrow{B A}$ and $\overrightarrow{B C}$ are called sides. They meet at vertex $B$ to form an angle. The angle can be referred to as $\angle A B C, \angle B$, or $\angle C B A$.

There are four kinds of angles:

An acute angle. Less than $90^{\circ}$.

An obtuse angle. Greater than $90^{\circ}$.

A right angle.

A protractor is an instrument used to measure angles.
The angles are measured in degrees. The protractor is marked with 180 degree ( $180^{\circ}$ ) units.

What is the measure of $\angle \mathrm{LMN}$ ?

Follow these simple steps to measure an angle with a protractor:

1. Place the arrow on the protractor on the vertex of the angle.
2. Place the zero edge on the side of the angle.
3. Read the measure of the angle.
$\angle \mathrm{LMN}$ measures $30^{\circ}$

1 Write obtuse, acute or right angle.

1. $30^{\circ}$
2. $118^{\circ}$
3. $90^{\circ}$
4. $27^{\circ}$

Give the measure of each angle. You may need to extend the sides of the angle for easier reading.
1.

2.

(4) Find the missing number.
8.75 - $\qquad$ $=6.36$
13.30 - $\qquad$ $=5.31$
10.871 - $\qquad$ $=9.682$
139.060 - $\qquad$ $=97.138$
2,108.6 - $\qquad$ $=1,039.9$
5,362.51 - $\qquad$ $=480.46$
(5) Draw similar figures to the ones given.
